LookMeUp

My Le - s4028203

Genre

- Pixel art sandbox
- Fashion/dress-up tool

Creative Context

- For playful fashion exploration and styling.
- Inspired by online dress-up games and fashion culture like Unnie Doll, dress-up games on Meiker.io

Interaction Design Principles

- **Mapping:** Click on clothing items in the wardrobe and they instantly appear on the character in the correct location (e.g., clicking a hat places it on the head).
- **Feedback:** Instant visual (sparkle) and auditory (snap sound) cues when an item is added.

Core Feature

Dressing up a pixel character.

- Users choose a base skin tone, face style, and hair.
- Users click on outfits from a categorized wardrobe.

Supporting Mechanics:

- Wardrobe categorization (e.g., tops, bottoms, accessories).
- Reset button to clear the character's outfit.
- Save/download functionality (planned).

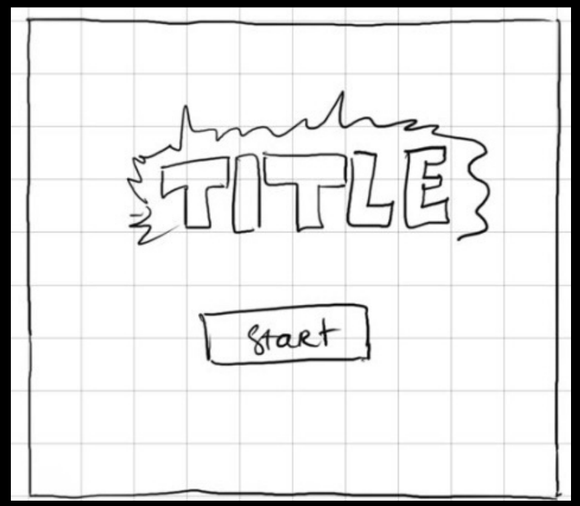
Novel Application of Interaction Design Principles

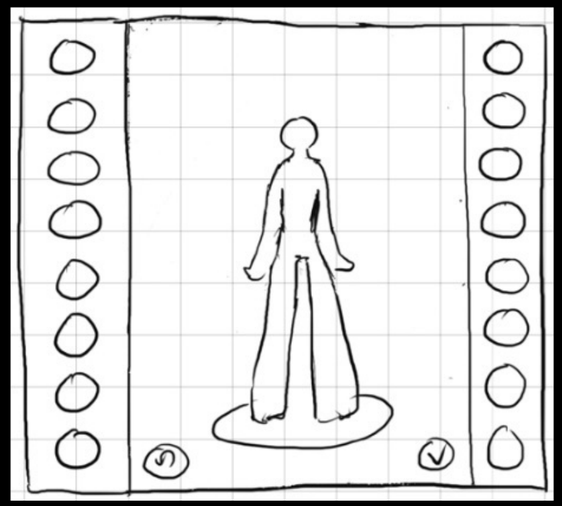
- **Mapping:**
  - Direct and immediate translation of selections onto the character for stylistic building, not just functional display.
  - Focuses on instantly realizing a "look" in a fun, direct manner without complex placement.
- **Feedback:**
  - Dual sensory cues (sparkle and snap) that emphasize the completion and satisfaction of a creative action.
  - Designed to enhance the creative enjoyment and rewarding nature of each fashion choice.

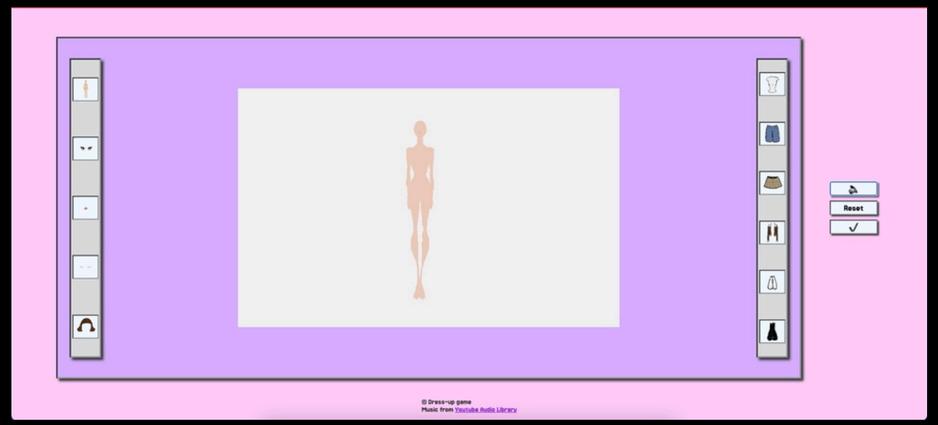
Technical Operation

- HTML, CSS, JavaScript.
- Canvas Interactivity: Konva.js for creating and manipulating the interactive visual elements on the canvas.
- Audio Feedback: Tone.js for managing sound effects like the snap sound on item addition.
- Assets: All pixel art characters, clothes, hair, UI icons, and sound effects are copyright-free or hand-made.

Design Judgments Through Exploration







- Initial Idea: Character centered with clothing categories on the sides.
- Alternative Choice: An earlier horizontal layout, but still different.
- Reason for Final Choice: The current layout provides clearer categorization and more intuitive navigation for the user, especially with a larger number of items, making it feel less cramped and more organized for a dress-up experience.

- Initial Idea: Early thoughts might have implied broader, more personal "custom avatar" options.
- Alternative Choice: Focusing solely on a pre-defined pixel character for dress-up.
- Reason for Final Choice: Attempting to represent unique individual appearances (like facial features and body shapes) by drawing all the intricate edges is technically complex and resource-intensive for this project's scope. It also shifts the focus away from the core goal of fashion expression. By using a pre-defined pixel character, I could concentrate on refining the dress-up mechanic and effectively demonstrating Mapping and Feedback.

Changes from Proposal

- **Refined Scope:** Narrowed focus specifically to a pixel art dress-up game, clarifying the initial concept of "playful self-styling" into a dedicated fashion tool and avoiding the complexities of true "custom avatar" replication.
- **Interaction Principle Emphasis:** Sharpened the focus on Mapping and Feedback as the primary interaction design principles, making them more explicit in the tool's design.
- **Visual & Audio Feedback:** Integrated more prominent visual (sparkle) and audio (snap) feedback than initially detailed, directly enhancing the "Feedback" principle.
- **Layout Evolution:** Shifted from the initial wireframe layout to the current, more structured and user-friendly interface for clothing selection.

Future Expansion

- **Expanded Wardrobe & Categories:** Add more clothing items, accessories, and potentially background options, with more refined categorization.
- **Color Customization:** Allow users to change the color of individual clothing items.
- **Animation/Pose Options:** Introduce simple animations or different poses for the character.
- **Randomizer Feature:** A "randomize" button for instant styling ideas.
